

Module 4: XLOOKUP – Only for Excel 2021 and Office 365

1. What is XLOOKUP?

✓ **XLOOKUP** is a powerful Excel function that replaces older lookup functions like **VLOOKUP**, **HLOOKUP**, and **LOOKUP**.

Syntax:

XLOOKUP(lookup_value, lookup_array, return_array, [if_not_found], [match_mode], [search_mode])

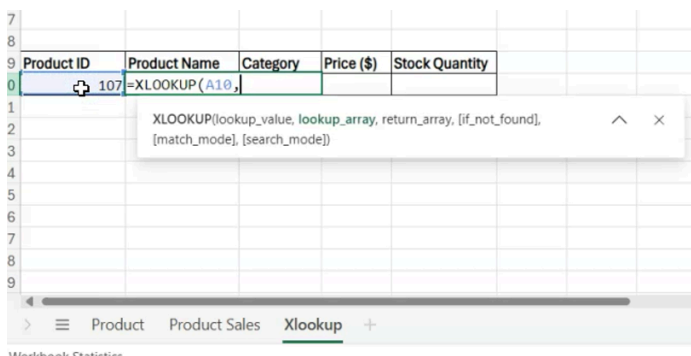

Key Arguments:

Parameter	Description
lookup_value	Value to search for
lookup_array	Where to look (column or row)
return_array	What to return (column or row parallel to lookup_array)
if_not_found	Optional – what to return if not found (e.g., "Not Found")
match_mode	Optional – 0=Exact (default), -1=Exact or next smaller, 1=Exact or next larger, 2=Wildcard match
search_mode	Optional – 1=First-to-last (default), -1=Last-to-first

How XLOOKUP is Better than VLOOKUP

Feature	VLOOKUP	XLOOKUP
 Direction	Only left-to-right	Left, right, up, down
 Column No.	Requires hardcoded column index	Uses direct range
 NA Handling	Needs IFERROR	Has built-in if_not_found
 Dynamic	Not dynamic if columns are changed	Fully dynamic
 Approx Match	Limited, defaults to approx	Exact by default
 Reverse Lookup	 Not possible	 Possible

Example:

Formula Bar: `=XLOOKUP(A10,Table1[Product ID],Table1[[Product Name]:[Stock Quantity]])`

Product ID	Product Name	Category	Price (\$)	Stock Quantity
101	Widget A	Electronics	25	50
102	Widget B	Electronics	35	30
103	Gadget X	Home Goods	45	20
104	Gadget Y	Home Goods	55	15
105	Tool Z	Tools	20	40
106	Tool W	Tools	30	25
107	Appliance Q	Appliances	150	10
108	Appliance P	Appliances	200	5

Product ID	Product Name	Category	Price (\$)	Stock Quantity
107	Appliance Q	Appliances	150	10

! 2. Handling #N/A and Approximate Matches in XLOOKUP

✓ Problem:

When lookup value is not found, `#N/A` is returned by default.

👤 Handling #N/A Using `if_not_found` Argument:

🛠 Steps:

`=XLOOKUP("Neha", A2:A10, B2:B10, "Not Found")`

If "Neha" is not found, it returns `"Not Found"` instead of `#N/A`.

✓ Approximate Match in XLOOKUP:

Use `match_mode`:

- `0` → Exact match (default)
- `1` → Exact match or next smaller item
- `1` → Exact match or next larger item

👤 Example:

	A	B	C	D	E	F
1	Product ID	Product Name	Category	Price (\$)	Stock Quantity	
2	101	Widget A	Electronics	25	50	
3	102	Widget B	Electronics	35	30	
4	103	Gadget X	Home Goods	45	20	
5	104	Gadget Y	Home Goods	55	15	
6	105	Tool Z	Tools	20	40	
7	106	Tool W	Tools	30	25	
8	107	Appliance Q	Appliances	150	10	
9	108	Appliance P	Appliances	200	5	
10						
11						

B2						
	A	B				
1	Product ID	Product Name				
2	1021	-XLOOKUP(A2,Table1[Product ID],Table1[Product Name],"Not Applicable")				
3						
4						

E8			
	A	B	C
1	Product ID	Product Name	
2	1021	Not Applicable	
3			
4			
5			

3. Wildcard Matching in XLOOKUP

✓ **Match_mode 2** enables wildcard search using:

- any number of characters
- ? → any single character

Steps to Use Wildcards:

=XLOOKUP("*an", A2:A10, B2:B10, "Not Found", 2)

| This will find any name ending with "an" (e.g., "Mohan", "Kiran").

✓ You must set **match_mode = 2** to activate wildcard logic.

 **Example:**

114

Best Practices

 Practice	 Reason
Use Named Ranges	To keep formula clean and avoid manual range update
Always set <code>[if_not_found]</code>	To avoid showing <code>#N/A</code> to users
Use structured tables	Works better with expanding datasets
Use <code>match_mode = 2</code> only if wildcards are intended	Avoid unexpected matches
Keep lookup and return arrays aligned	Prevents formula errors and confusion

Key Points / Important Notes

-  **XLOOKUP** is more powerful and flexible than older lookup functions.
-  It can **search in any direction** – left, right, top, or bottom.
-  You don't need column numbers – it uses **ranges directly**.
-  You can handle errors, match modes, and search direction inside the same function.
-  Available only in **Excel 2021 and Office 365**.
